API Use Case Statement

Continuous bank transaction access for personal finance analytics

1. Applicant and Project Details

Applicant name	Veerbhadra
Contact email	mahantveerbhadra596@gmail.com
Project name	FinPilot - Autonomous AI Financial Health Copilot
Project type	Personal finance analytics web application (hackathon project)
Target users	The applicant only (single user, own bank account)
Access method	User-consented Account Aggregator flow (Setu)

2. Purpose of API Use

I am building FinPilot, a personal finance web application that gives me a live, automatic view of my own money. I want to connect my own bank account through the selected API services so that my transactions are fetched continuously. When I make a payment, it should appear on my dashboard automatically, with no manual entry or statement uploads.

Today, tracking expenses means typing each payment by hand or importing statements after the fact. That is slow, error-prone and always out of date. Continuous transaction access removes that gap and lets the analytics run on current data.

3. How the Data Will Be Used

- Automatic ingestion: new bank transactions are added to my account in FinPilot as they occur.
- Categorization: each transaction is classified (food, rent, transport, bills, and so on) and merchant names are normalized.
- Recurring payment detection: subscriptions, EMIs and regular bills are identified, including redundant subscriptions.
- Anomaly detection: unusual or unexpectedly large spending is flagged for my review.
- Cash-flow and savings insights: monthly trends, savings rate, emergency-fund coverage and debt pressure.
- Forecasting: probabilistic cash-flow projections and what-if scenarios based on my own history.

4. Data Scope and Minimization

Data requested	Transaction history and balances for my own account(s) only
Not requested	Data of any other person, other users' accounts, or unrelated financial products
Frequency	Continuous / periodic refresh while consent is active
Consent	Given explicitly by me, can be revoked by me at any time
Sharing	None. Data is not shared with, sold to, or disclosed to third parties
Advertising / profiling	Not used for marketing, advertising or credit decisions

5. Security and Privacy Measures

- Authentication: access to the application requires sign-in with verified user identity tokens.
- Isolation: each record is tied to a user identifier and queries are scoped to that user.
- Transport security: all communication with the API provider and the app uses HTTPS.
- Secrets handling: API keys and credentials are kept in server-side environment variables, never in client code or source control.
- Audit and rate limiting: API requests are logged and rate limited to detect misuse.
- Sensitive data handling: personal identifiers in receipts and documents are redacted before processing.

6. Retention and Deletion

Transaction data is kept only as long as needed to provide my analytics. I can stop data collection by revoking consent, and I can delete my stored transactions and account data from the application at any time. No data is retained for any purpose other than the analytics described above.

7. Technical Overview

Frontend	Next.js and React web application
Backend	Python FastAPI service with analytics and forecasting modules
Storage and auth	Firebase Authentication and Firestore
Integration	Consent creation, data fetch and webhook handling for the Account Aggregator API

8. Compliance Statement

I will use the API services only for the purpose stated in this document. I will comply with the provider's terms of service and with applicable Indian data protection and financial data-sharing rules, obtain consent before accessing any data, and will not use the data for any unlawful purpose.

9. Declaration

I declare that the information in this statement is true and accurate to the best of my knowledge.
